Comparison of Global light (A) and Custom light (B) in a scene

light. Similar to point light, one does not get the option of setting Fog Intensity and Cone Angle by using Infinite light.

- **Spot Light:** Spot light is used to shine light in a particular direction from a pre-determined position in your scene. The ground projection, light ray, and an arrow indicating the light's direction show the colour of the light. You can use a Cone Angle to specify the range of the light.
- **Area Light:** Area light allows you to use advanced lighting properties. You will be able to use Area light if you use a custom renderer.

There are four types of Custom lights in Autodesk MotionBuilder

Adding and removing lights

In order to add light to your scene, all you need to do is drag a light asset to the Viewer window. You can locate the asset in the Asset Browser. By default, a newly added light is always set to Point light. As soon as the new light is introduced, the Global light gets extinguished.

If you wish to add light to the scene without lighting each object, you need to carry out the following steps:
