

- Choose the light from the assets listed by the Scene Browser.
- Go to Light Settings and disable “Cast Light on Object”.

Adjusting the brightness

Autodesk gives you the option to modify the brightness of the light which you have added to a scene. You can do so by going to the “Light Intensity Settings” under the “Property window”. A lower intensity value gives soft light. On the other hand, a higher intensity value gives hard light. If it is set to 0, there will be no light.

Changing the colour of the light

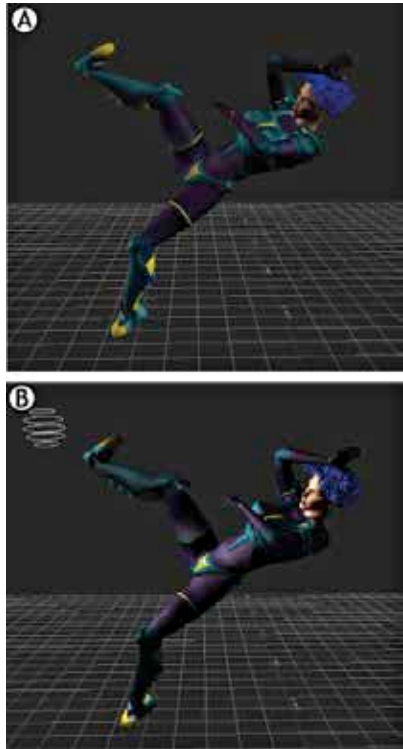

By default, the colour of the light is set to pure white. If you want to adjust the colour, you need to carry out the following steps:

- Go to “Colour settings”.
- Select the light that you want to adjust.
- In the settings menu, enter the value of your choice.
- Click the Colour button to access the Colour window. Here, you can adjust the colour and the mode of the selected light.

Specifying the interest

Specifying the interest of light helps you define the direction in which you want the light to be cast or projected. You can do so by carrying out the following steps:

- Select the light whose interest you want to adjust in the Viewer window.
- To define an element as the interest of the selected light, you need to Alt-drag it to the Interest field under Light Settings.

Newly added lights are always Point light by default.
