

- **Environmental effects:** You can also use shaders to create several environmental effects such as fog, clouds, rain, fire, and snow. To create the desired effect, you need to apply it to an object that defines the position of the effect. You do not need to append the shader to the object to achieve this. All you need to do is replace the object with the shader. In this way, the model remains hidden, and the effect of the shader becomes visible.
- **Shadows and lighting:** In order to effectively impart the atmosphere of a scene, you cannot just rely on lighting. You have to use shadows to add liveliness to the scene. Fortunately, you can use shaders to add realistic lights and shadows to various planes and objects in your scene. Further, you also have the option of adjusting the intensity of the shadow to establish subtle differences between various objects.
- **Surface effects:** To imply that your models have varying degrees of depth, you can use shaders to produce surface effects. These effects prove to be highly effective when it comes to defining additional depth and detail in your objects. Some of the most commonly used surface effect shaders are “Wireframe”, “Bump Map”, and “Faceted”.

Applying a shader

Various shaders can be applied directly to objects to gain different results. Follow these steps to apply a shader to a model.

- Go to the Resources window and click on the “Asset Browser” tab.
