

- Under this tab, you will be able to see a folder named “Shading Elements”. Click on it to expand the folder.
- A number of options will appear. Click on the “Shaders” folder. You will be able to see all the shaders.
- Choose the shader that you want to use and then drag and drop it on a model in the Viewer window. You will be able to see a context menu on your screen.
- This pop-up menu will have three options: Replace All, Replace by Type, and Append. Select the option that suits your requirement.
- The “Replace All” option replaces all the shaders applied to the object with the selected shader.
- The “Replace by Type” option replaces all shaders belonging to a particular type with the selected shader.
- The “Append” option adds the shader of your choice to the object.

Conclusion

Familiarity with various lighting and shading effects that are available in Autodesk MotionBuilder can help you take your visual narrative to the next level. While creating a scene, it is essential to show the difference between various objects in terms of their physical appearance. This can be done by adjusting their colours, textures, depth, and surface appearance. You can also use different light and shader effects.

Effective usage of lighting and shading effects not only introduces a degree of realism to your scenes but also helps you drag the attention of your audience to the important elements. In this way, lighting and shading play a vital role in enriching the overall viewing experience.
