

refraction, diffraction, indirect illumination, caustics, depth of field, motion blur, and non-photorealistic rendering.

Rendering on Premiere Pro

Adobe's Premiere Pro is one of the best software for video editing. You must have noticed your seniors and professors who work extensively with graphics and video content use Premiere Pro exclusively. The main reason behind that is, it is easy to use and is an immensely powerful tool. Here, it is safe to say that rendering is also a comparatively easier task on this software. Follow the steps below to render your video without any hassle.

Adobe Premiere Pro export window

• Defining the work area

To begin with, you must define the work area that you wish to render. To begin the process, place the player's head at the starting location of the section and click on 'I'. This will mark the 'in' point. Next, repeat the same process for the end of the section and click on 'O' to make the 'out' point.

You will have to do this for both the media viewer and the timeline. Once done, the area you have marked with the 'in' and 'out' points will be highlighted. However, if you need to change the area, you will only have to drag the markers at the end of the new area of your choice.

• Render effects from in to out

With this option, you can render out all the red bars that may appear in
