

your timeline. “In to out” rendering looks particularly for transitions and other effects that are responsible for the maximum number of lagging issues in your projects.

- **Render from in to out**

Rendering from in to out can be your blessing in disguise, especially if you do not have a big project to take care of. This option will render everything that falls within the work area that you have marked with a red or a yellow bar. However, it is important to remember that for larger projects, this option seems to make things more time-consuming.

- **Render audio**

Rendering audio is a rather easy procedure and works wonders if you are working with a complicated audio file, like music tracks or sounds with many effects, but comparatively simpler video footage. Here, you must remember that Adobe does not render your audios by default besides your video, and you will have to take care of the process separately.

Rendering on MotionBuilder

MotionBuilder is one of the more popular software for rendering images. Like the Premiere Pro, this software is also extensively used in the industry. However, it is mostly used for rendering images, unlike Adobe's Premiere Pro, which is predominantly a tool for video editing. Here is how you can render a scene using Motion Builder:

1. Go to the Menu bar visible on your screen. Choose the 'Render' option from 'File'. Upon doing this, your render window should appear.
2. Next, click on the 'Browse' option. Here, you will be required to set the path for the files you render.
3. There are two-time fields on the render window. They are termed 'Start Time' and 'Stop Time'. Use the two fields to set your start and stop times.
4. Now, you must choose a format for your picture.
5. Next, select the format of your output from the option called 'Output Format'.
6. Click on the option named 'Render Movie'. The option you selected in the previous step will decide the window that will pop up on your screen next. Select your compression settings and adjust them to suit your preferences.
7. Click on the 'OK' button, and the image will be saved at the destination path specified by you.
