

Handbrake

First introduced by Eric Petit in 2003, Handbrake is an open-source tool primarily used to convert boring, outdated videos to almost all formats to a group of new, largely acceptable codecs. It is free software highly supported by Mac, Linux, and Windows. Handbrake is great for cropping, resizing, restoring low-quality videos, and creating new ones that work well on almost all devices that support modern video formats such as tablets, mobile phones, game consoles, computers, and web browsers, and TV media players.

Besides this, there are hundreds of perks that Handbrake users enjoy every day, such as easy audio volume adjustments, preserving existing subtitles, etc. Handbrake supports various tools, including Libav, *264, and *265, to create top-notch quality MPV and MP4 video files.
