

OBS Studio

Open Broadcaster Software or OBS studio is an open-source cross-platform built with QT and maintained by the OBS project. It's a free live streaming and video recording program that is highly compatible with macOS, Microsoft Windows, and Linux distributions. This software is written in C++, C, and Qt and primarily provides real-time source and device capture, decoding, encoding, broadcasting, and scene composition. Once installed on your PC, you can use

OBS to record or stream videos using multiple streaming protocols such as RTSP, RTP, RTMP, etc. It offers multiple scenes with varying configurations to be set up for each scene, thus, allowing you to incorporate production quality that rivals what mainstream software do.

Using multiple sources like recordings, window browser captures, uploaded images, webcam video, and text annotations, OBS permits users to make livestreams much more engaging.
