

TreeSize

Written by JAM software, TreeSize is a disk space analyser that scans your volume to check the size of all folders and break it down to file level, quickly get rid of unwanted stuff, and provides a stunning visualisation. Microsoft currently supports this software that includes native 32 and 64-bit support for all client/server versions and window versions. The primary function of TreeSize is to determine and display folder sizes and to create tables, charts

including pie charts, treemaps, and bar charts. This data collected in TreeSize can be exported to clipboard, HTML, XML, plain text, and Microsoft Excel formats.

The disk space can be easily monitored using TreeSize. As of version 3.4, it is possible to access mobile devices and android devices that are connected to the computer via Media transfer Protocol and WebDav, respectively. TreeSize can also access Amazon S3 Storage, SharePoint, and FTP servers, and list out your directory sizes remotely.
