

Voidtools Everything

Everything is a desktop search engine that rapidly locates files and folders by filename for Windows. Developed by David Carpenter, it is free software that finds the file and folder within a few seconds after tipping the enter key. On average, 1,20,000 files will take around one second to index and 1,000,000 files around a minute. Voidtools Everything basically turns your computer into a google search for all files on your PC. Users can easily search multiple files and folders by their filename and content.

If you have ever come across how the search engine works, then you must be aware of "indexing," too, which means search engines build up the database of available Internet files and then organise this information systematically by building an index. Everything is the same as an index that is responsible for managing your local file system. Installing everything is an easy job as it can be downloaded from its official website, and the search process can start.
