

Virus Total

VirusTotal is an online web application service to analyze suspicious files and URLs. It helps in the early recognition of spyware and harmful content by using its antivirus engines and website scanners. Additionally, it follows an API system that allows its users to access any information generated by VirusTotal. Virustotal works free and completely objectively as it is accessible to end-to-users for non-commercial uses. VirusTotal's data is the output of several different antivirus engines. This data also comes from website scanners, file and URL analysis tools.

Virus Total security is carried out smoothly by performing various levels of sharing of data with one another. Scanning reports produced by VirusTotal are shared with the VirusTotal community. Users can contribute through comments and vote on whether the content is harmful. Any other antivirus solution that detects a submitted file as malicious displays the engine's detection label.
