

Caffeine

Every operating system has a power-saving mode that is automatically triggered when the user has moved away from the device and hasn't made any action. Unfortunately, we all know that this is not always the case. Sometimes we're compiling code, transcoding video or simply waiting for a download. In such situations, the operating system turning on the screen saver or logging you off or even entering standby mode can be quite irritating. Caffeine puts an end to that.

So, next time, instead of having to continue running the mouse pointer over the display, turn on this app, and your work is easily done. Once installed, Caffeine comes with a manual toggle and even a command-line instruction for activation. Simply use the command 'caffeinate' and you can move away from the screen without worrying about your work getting stalled.
