

Shortwave

Shortwave is an open-source Internet Radio player for Linux distros. It has a massive library of community-curated Internet Radio stations so users can install the app and get started right away without having to hunt for radio station links. The app is a successor to the popular radio app called Gradio. The dev decided to rewrite the entire code in Rust to make the app much quicker and easier to maintain.

Aside from the community-curated library, you can also open any other Internet Radio channel, import your old collections from Gradio and stream to devices such as the Google Chromecast. There's even a module that can identify the song that is currently playing on the radio so you don't have to run Shazam or Soundhound the moment you discover a catchy new song.
