

Little Snitch

Even though there are fewer virus risks to Mac computers, there is still a need for data security. Users can prevent personal information from being sent out using Little Snitch for Mac. When an app tries to connect to an Internet server, Little Snitch displays a connection warning, enabling you to choose whether to accept or reject the connection. No data transmission happens without your permission. Your choice will be saved and applied automatically in the future.

Little Snitch for Mac is available for free for 30 days. Following that, \$29.95 gets you the full version with no limitations. In terms of functionality, the software is self-contained and operates in the background. Little Snitch makes Internet connections visible. Inbound and outbound network connections can be monitored using Little Snitch. Users can find an excellent live dashboard with traffic visualizations as an optional feature.
