

Files by Google

Files is the file management app provided by Google. The basic functionality of Files includes browsing files, clean up of storage, file transfer in offline mode, and media consumption, though freeing up space is the primary application. Moreover, it keeps the phone organized and in good condition. The app consists of three tabs, i.e., clean, browse, and share. The clean tab allows

freeing up space, removing unused apps, old photos, and duplicate files, checking the free space, and clearing the cache. The browse tab allows users to search the files present in mobile in folders, such as audio, images, video, downloads, documents, and received files. One can easily open, delete, rename, move, and share files.

The share tab allows users to share the files with other users having the same app installed. The file-sharing occurs quickly and in offline mode too. It is a perfect solution that eases out file searching while regulating the performance of the phone with regular clean-ups.
