

It is the most compatible server that works with RHEL. It also has an open-source library, which is highly stable.

Pros:

- It is free software and all the added services are available for free.
- Provides an all-around allocation that is supported extensively by the community.

Cons:

- It does not get any support from any other forums as it is having a lesser user base than other distros.

Conclusion

A Linux server is generally based on open-source libraries and is also available at a very low cost. It provides its users with many features that other operating systems lack. Therefore, after you have installed any of the above-mentioned Distros, you will have a system that will provide you with better security and stability.
