

the power of flexibility and copy-paste commands. So, if you want to learn more about the important things that are connected to the command line and structure, make sure you read and understand all the commands that are given below. This is a complete guide with more than 50 commands for daily use.

List of basic commands used in Ubuntu for helping beginners

*Note: Wherever you see <package-names>, replace it with the real one.

1. apt-get update

One of the most important commands in Ubuntu; apt-get update is used for updating your list of packages. Do not mix it with the commands that would update your software. This would not do that, it will simply update the package list. Before using any apt-get command, you need to provide root permission.

2. apt-get upgrade

This command can be paired with the above command and used together after giving the root permission. The upgrade command in Linux would directly update any particular software after updating it. If you are using the upgrade command to remove or install the packages, it won't do that for you.

3. apt-get dist-upgrade

This command can be paired with the two above and it helps in upgrading all your system's packages. It can also upgrade other packages, remove them from your list and install the extra packages you want. All these things can be done with this command.

4. apt-get install <package-name>

With the help of this command, you can install either software or a package that goes with the name you put in <package-name>. This command is important as it offers a shortcut that helps in installing the above mentioned.

5. apt-get -f install

There might be a time in future when you would face problems in installing a particular software. There are different reasons for this problem. It can be caused due to the dependency of software on others or a failure of software downloading. This command can help in fixing any broken installation run.
