

6. apt-get remove <package-name>

By running this command you can easily get rid of any unwanted software. The only thing you have to do is insert the right package name. It will straight away uninstall the software you want without affecting the dependent packages.

7. apt-get purge <package-name>

On running this command by putting the right package name, you can easily remove any software and all the dependent packages. It is an important command and a useful one as well.

8. apt-get autoclean

Junk files may pose problems and slow down your device. To remove all the (.deb) files known as Debian, you just have to run this command. If you want to manually clean your device, these files can be found in archives, var, cache, and apt.

9. apt-get clean

If you want to remove all the cache files or junk files, then this command is appropriate to use. This is not a package centric command but before using this you need to ensure that you need all the cache cleaned. This will eventually free a lot of space and will help in uninstalling and installing software quickly and easily.

10. apt-get automove

Most devices become slow when the residues of previous applications and packages are left behind. But if you want to remove all of them then this command is absolutely apt for you. It will instantly remove all the footprints as well as dependent files of all the previous applications that were installed.
