

11. dpkg -configure -a

After installing any package, you need to unpack it and then install. You now don't have to go through all that hardships because using this command will easily unpack and then configure your installed package.

12. sudo nano /etc/apt/sources.list

Another very important and helpful command that comes in handy in nano editor. It helps in displaying the repository source list in this editor. So use this command to ease up your working with the nano editor.

13. sudo apt-get download <package-name>

This single command will work as your downloader as it helps in downloading a package. But if you wish to install the package, you need to combine this with some other command.

14. Ctrl + C

Do not confuse this command with the copy command of windows. This Linux command helps in killing a process with a single Sigint.

15. Ctrl + Shift + C

Now while working on Linux, this is the command you need to learn by heart because it helps in copying the codes.

16. Ctrl + Shift + V

Remember the Ctrl+V command in windows? This command works the same as that. It helps in pasting all the copied commands. It is a helpful command when you have to repeat commands more than once. You can simply copy and keep pasting for how many times you want.

17. nano <filename>

Nano is a command line text editor that is a useful command in Linux. When you run the above command with the right file name, you can simply edit the file name you input.

18. sudo nano <filename>

This command also works almost the same as that of the previous command. The only big difference between these two is that in this one you can edit the file with the privilege of being a super user.
