

reboot helps in simply rebooting the system. You will be using this command at times when you have to use a newly installed package or software.

24. Ctrl + Alt + T

This command will help in opening the terminal windows on Ubuntu's command interface. This is one of the pre-installed software that comes with the standard Ubuntu.

25. pwd

This command is a simple one and it helps in printing the work directory. When you use it with a username, you just have to input the details and it will print it on the directory.

26. ls

Want to know the list of your directory? This is a simple command that helps in listing all the items in your directory. If not specified, it will list down all the work directory.

27. cd

This command is also quintessential because it will help in changing your work directly when you specify it. When you do specify the name, it will change to home irrespective of your location.

28. cd ..

The full stops that are written in front of "cd" represent the level. When you give this command in Ubuntu it will simply level up the directory.

29. cd ~

This command simply helps in changing the name of your directory from the home location.

30. cp

This is a copy command given to the program and it will simply help in copying a directory or a file.

31. mv

This command helps in renaming a file in the directory and when you call it later, you will have to use the same name.
