

32. rm

It is an easy way to remove a file from the program or package. It can also help in removing the directory.

33. rmdir

This command helps in removing the empty directory. You don't have to worry about deleting anything useful because this command will work on all those directories that are empty.

34. mkdir

This is the command that helps in making a directory. As soon as you run this command on your screen, it will immediately make a new directory. But yes, you will have to specify a name.

35. man

Use this command in front of any other Ubuntu command and you can access the user manual page or help page for that command.

36. sudo

This command helps in executing commands with super user or root standards. This can be used by any standard user.

37. adduser <username>

This command when run on the screen helps in adding another user to your directory.

38. passwd <username>

When you put the username in the given space, it will change the password for that profile. If you want to change anyone else's password you require root privilege.

39. time

This the command that will show the system summary of the resource usages after running a command.

40. date

Including the time zone, this command will also show you the current time and date of the system you are using.
