File Structure and Boot Process

Understand how Linux organises files and folders in its own way and also gain insights into the way Linux boots up the system

Introduction

Every operating system has a certain way of organising its own files as well as files belonging to the user. There is also a bifurcation of file permissions and selective visibility is applied to sensitive folders and files so that the user might not accidentally delete those.

Linux is very much similar to Unix in that regards but completely opposite to the way Windows does things. Here, we'll learn the different folders that Linux uses to organise its files and how you can figure out where your personal and application files might lie.
