

A screenshot of the Vim text editor's help screen. The text is displayed in a monospaced font on a dark background. At the top, it says 'VIM - Vi IMproved' followed by 'version 7.4.1848'. Below that, it credits 'by Bram Moolenaar et al.' and mentions 'Modified by <amazon-linux> am@amazon.com'. A line states 'Vim is open source and freely distributable'. The main body of the screen contains a message: 'Help poor children in Uganda!' followed by a list of commands and their purposes: ':help iccf<Enter>' for information, ':q<Enter>' to exit, ':help<Enter>' or ':F1' for on-line help, and ':help version7<Enter>' for version info. In the bottom right corner, '8.8-1' and 'All' are visible.

VI Crash Course

The fundamentals of VI, its two modes, and how to navigate around them using various commands

Introduction

VI (Visual editor) is the default text editor found on almost all Unix systems. VI allows you to edit an existing file, produce a new file, or just read a text file. Many Linux users prefer the VI for editing text because of its user-friendly interface. All you need is some fundamental knowledge of VI and some commands.

Highlights of VI

- It saves quite a bit of your time in typing as you are not required to use any arrow keys. It uses the standard alphabetical keys to carry out all commands.
- It is free to use.
- Commands are short.
