

3. Commands to delete text:

- **X**: Character previous to the cursor location gets deleted
- **x**: Character at the cursor location is deleted
- **Dw**: Characters from the current cursor location to the next word are deleted
- **d^**: Characters from the current cursor location to the start of the line, are deleted
- **d\$**: Characters from the current cursor location to the end of the line are deleted
- **Dd**: Deletes the line on which the cursor is located

When you delete any text, it gets stored in a temporary buffer that is changed every time you delete new text. Only the current text stored in the temporary buffer can be pasted back into your file.

Copy and Paste commands

Copy lines or words from one place and paste them on another place by using the following commands:

- **Yy**: Current line gets copied
- **8yy**: Copies from the current line to 8 lines below
- **yw**: Copies the current word
- **p**: The copied text is pasted after the cursor
- **P**: Pastes the copied text before the cursor

When you copy any text, it gets stored in a temporary buffer that is changed every time you copy a new text. Just the current texts stored in the temporary buffer can be pasted back into your file. So, make sure to use the 'p' command immediately after you copy any text.

Commands to determine line numbers

- **:=**: It provides the number of the current line
- **:**: It provides the total number of lines
