## Changing Permissions in Ubuntu

- `-rwx-` `--`: The owner has complete permissions, while everyone else has none (beneficial for personal scripts).
- `-rw-rw-` `--`: The owner and group are both able to read and write (beneficial for collaborating with group members).
- `-rw-r-r-` `--`: Only the owner could read and write to the file, whereas the group and other users could only read it (beneficial for storing personal files on a shared network).
- `-rw-` `--` `--`: The owner can read and write, but everyone else does not (beneficial for storing personal files).

You can use a few additional commands with `chmod`, such as `setuid` and `setgid`; however, they are a little more involved, and most users will not need them.

## The Root or Super-User and System Files

We do not usually run systems with numerous users nowadays. Then why should we be concerned about permissions at all?

Unix and its descendants—Linux, OS X, and so on—distinguish between tasks performed by the user, tasks performed by an administrator or with
