

user cannot run the commands or interact with the system. Furthermore, the processes can also run like that of the user.

The Nologin Shell also helps the user in executing several tasks with a single click. You can log in as a user with the help of the Nologin Shell. But, if you directly log in as a Nologin Shell user, then the computer will bar your entry and a refusal message will be displayed. Your screen will see a message that says “account is unavailable.” However, if the `/etc/nologin.txt` file exists, it will directly show up the contents of the file rather than show the default message. Here is the code that can help you in understanding the process of the shell. You will have to create the existence first.

- # cat /etc/shells
- /bin/sh
- /bin/bash
- /sbin/nologin
- /bin/dash
- # useradd -s /sbin/nologin test
- # su - test

Conclusion

User and group management is a major concept that needs a lot of understanding. This article covers a few major points that you need to be thorough with. There are chances that users might have supplementary groups. Notably, `/etc/group` file is the command that helps in determining the membership of a user or an account in the supplementary groups.

Therefore, users can only get access to a file or directory if they have access to their groups. Moreover, in many ways, it would not matter if the groups have primary or secondary access for the same user because all the users with access to a particular group can do anything they want. **1**
