

In this FastTrack, we're going to take you through the installation steps for the operating system, followed by all the necessary server applications required to enable your server instance to host apps, and then we'll take you through the nuances of tinkering with the various aspects. Along the way, you will learn the popular Linux commands, how to use them properly and even use operators to chain multiple commands to get a lot more done in much less time. We'll then take you through the concepts of mounting drives, playing around with network commands before finally putting it all into practice in a simple DIY chapter. By the end of this, you should be able to prop up a server that can host multiple simple websites.

Like always, we're open to suggestions about what you'd like to learn in future FastTracks. Write to us at editor@digit.in and let us know. Also, if you're writing to us in the month of August, you even have a chance to win a free Amazon Kindle e-Reader!
