Examining a process in Linux

additional information in multiple ways.

However, before that, we need to understand the process that goes under examining active process (or processes) in Linux:

1. Open the terminal window on Linux.
2. Use the ssh command for login purposes for remote Linux.
3. Type the `ps aux` command to see all the running processes in Linux.
4. Alternatively, you can issue the `top` command or `htop` command to view the running process in Linux.

Viewing Active Processes in Linux

Moving on to the kind of commands that work in Linux. Here are some of the most important ones along with their functions:

1. **Ps Command:** “PS” or Process Status is similar to “Task Manager” that pop-ups in a Windows Machine. The command is somewhat similar in function to the “top” command. It displays information about the selected active processes.

```
$ ps -aux
```

```
$ sudo ps -a
```

2. **Top-System Monitoring Tool:** It is a powerful tool that offers a dynamic real-time view of a running system. It helps you with a view of Linux server resources usage. Here’s an instance of the same.
