

Filesystem

After the device and mount point, the third column is for the filesystem. The filesystem depicts the type of the filesystem of the partition. Fstab supports many file systems, but the most common ones are:

- **ext2 and ext3** - Earlier, ext2 was the default filesystem for Linux. But with technological changes, ext3 has become the default filesystem. Ext3 is the new system that is more advanced and user-friendly. It differs from ext2 in terms of journaling. For example, ext3 will make sure you do not lose any information from any file if your system crashes.
- **ReiserFS** - Just like ext3, ReiserFS is also a journaling filesystem. It is more advanced in terms of functioning than ext3. ReiserFS is now used by Linux distros. It has become the default filesystem of many Linux devices.
- **Swap** - Swap is the most common filesystem type. Swap is used for your swap devices.
- **VFAT and NTFS** - The Windows devices that you use are probably NTFS or VFAT. The NT series uses NTFS, and the 9x series uses VFAT. For 2000 and XP, you can choose which filesystem you want. Both of these can have a VFAT file system also. If you are writing Windows partitions from Linux, then format them to VFAT.
- **Auto** - Auto is not a filesystem type. Auto means to let the devices automatically select a filesystem. If you are using any media product like CD or floppies, then allowing the system to select a filesystem is smart.

```

tecmint@TecMint ~ $ lsblk -f
NAME        FSTYPE LABEL        UUID                                MOUNTPOINT
sda
├─sda1      ntfs      WINRE_DRV    D4A45AAAA45A8EBC
├─sda2      vfat      SYSTEM_DRV   185C-DA5B
├─sda3      vfat      LRS_ESP      0E60-2E0E

Filesystem types

Mount options

This is the fourth column in the fstab list for devices. By far, this is the most confusing column of all. There are many different options available that
