

As you will not be able to write to the CD-ROM, there is an `exec` option present in this command. This option is helpful if you wish to execute the command from the CD.

Note that the `no auto` option is used for both the CD and floppy in the command. This means that they will not be able to mount automatically if your system boots up. This is helpful for media that is removable. Sometimes, these media options are not even present when you boot your system.

```

File /etc/fstab
# /etc/fstab: static file system information.
#
# Use 'blkid' to print the universally unique identifier for a device; this may
# be used with UUID= as a more robust way to name devices that works even if
# disks are added and removed. See fstab(5).
#
# File system            mount point            (type)      (opts)      (dump/pass)
UUID=7d263ca8-103d-4aeb-8229-bafe75504705 /                       vfat        defaults,noauto,noexec,noatime 0 1
[volker@volker-pc ~]$
  
```

Fstab entries for floppy and CD-ROM

Editing fstab

Before you edit your filesystem, ensure that you create its backup.

1. If you want to edit the file in Ubuntu, use the command:
`gksu gedit /etc/fstab`
2. If you want to edit your file in Kubuntu, use the command:
`kdesu kate /etc/fstab`
3. If you want to edit your file in the terminal, then run the command:
`sudo nano -Bw /etc/fstab`
 - `-B` = Backup original fstab to `/etc/fstab~`.
 - `-w` = disable wrap of long lines.

Useful Commands

1. To see the contents of the file, type the following command:
`cat /etc/fstab`
2. If you want the list of all the UUIDs, then use either of these two commands:
 - `sudo blkid`
 - `ls -l /dev/disk/by-uuid`
3. To make a list of partitions and drivers of your system, use the command:
`sudo fdisk -l`
