Installing a Linux Server Distro - Ubuntu Server

Running a web server requires an OS which is reliable and offers flexibility of allocating resources

Overview:

Linux serves as the base of the computing system used for many cloud servers, web servers, and other purposes. Linux system administration is all about managing all the aspects of a server. This involves everything from designing the server, installing the server and all the other aspects associated with the hardware, the software installation, creating virtual hosts and assigning them, managing applications required for each client, etc. Modern day server administrators have to be familiar with a wide variety of operating systems, of which Linux is by far, the most popular.
