

Consult Usage

To check the free disk space and disk capacity, use the following command:

From the Activities overview, launch the Usage application.

Select the Storage tab to see the overall Utilized and Available disk space for the system, as well as the space used by the Operating System and common user folders. By ticking the box next to the directory name, disk space may be released from the user's folders and subdirectories.

What if the disk is completely full?

If the disk is completely full, you should delete files that are no longer necessary or that you will not utilize and make backups of crucial data you won't need for a period of time, and remove them from your hard disk.

Create a startup disk

A startup disk in this sense is a USB flash drive from which you may boot and install Ubuntu. The USB flash drive must have a capacity of at least 2 GB. When you create the startup disk, any data on the USB flash drive will be erased.

It is assumed that you have downloaded an ISO version of Ubuntu.

To make a Startup Disk from an Ubuntu ISO image, follow these steps:

Launch Startup Disk Creator by typing its name into the Activities search box.

If the ISO image is in your Download folder and there is only one ISO image, Startup Disk Creator will have chosen it for you; otherwise, choose the proper ISO image.

If your computer only has one USB flash drive, Startup Disk Creator will have chosen it for you; otherwise, choose the right disk.

Make a Startup Disk by clicking the button.

To confirm, click Yes. The whole procedure should take no more than 10 minutes.

When the "Installation Complete" window appears, press the Quit button.

Check Performance and Wipe Drives

To check the speed of your hard disk, do the following:

Disks may be accessed through the Activities overview.

Select the disk from the left pane's list.

Select Benchmark disk from the menu by clicking the menu button.
