

Start Benchmark then make any necessary changes to the Transfer Rate and Access Time parameters.

To see how quickly data can be read from the disk, click Start Benchmarking. An administrative authority may be needed. Enter your password or the password for the administrator account you want to use.

If the Perform write-benchmark checkbox is selected, the benchmark will measure how quickly data can be read from and written to the disk. This will take more time to finish.

When the test is completed, the results will be shown on the graph. The green dots and connecting lines reflect the samples collected; they correlate to the right axis, which represents access time, displayed against the bottom axis, which represents the percentage of time elapsed during the benchmark. The blue line indicates read rates, while the red line represents write rates; they are represented as access data rates on the left axis, plotted against the percentage of the disk travelled, from the outside to the spindle, on the bottom axis.

Values for lowest, maximum, and average read and write speeds, average access time, and time elapsed since the previous benchmark test are shown below the graph.

If you have a portable disk, such as a USB memory stick or an external hard disk, you may want to delete all of its files and directories from time to time. This may be accomplished by formatting the disk, which deletes all files on the disk and leaves it empty.

Create a detachable disk format:

Disks may be accessed through the Activities overview.

Choose the disk to be erased from the list of storage devices on the left.

Ensure that you have got the correct disk. If you choose the incorrect disk, all files on the other drive will be erased.

Click the menu button in the toolbar under the Volumes section. Then choose Format Partition.

Select a file system type for the disk in the window that appears.

Choose FAT if you want to use the disk on Windows, Mac OS, and Linux systems. If you only want to use it on Windows, NTFS may be a better choice. As a label, a short explanation of the file system type will be provided.

Give the disk a name, then click Next to proceed. A confirmation box will appear. Examine the information carefully before clicking Format to erase the disk.
