

Set Up a Web Server in Ubuntu

Setting up the works - Apache, MySQL, PHP and Virtual Hosts

We can set up the web server on Ubuntu Server OS, in fact, it's one of the more popular server operating systems. Apache Virtual Host allows users to set up and run multiple websites on a single server. While Apache virtual hosts are of two types, their functionality is quite similar but you can use any of them to host other websites. These are the two types:

- IP-based Virtual Hosting: This type of server host multiple websites with a different but a unique IP address
- Name-based Virtual Hosts: You can add multiple websites through a single IP address only

Through this tutorial, you will learn how you can set up Apache Virtual on Ubuntu 20.04 system. However, we can also set up the "LAMP"
