

(Linux, Apache Web Server, MySQL, and PHP) stack that is a group of open-source software used to host several web apps and dynamic websites written in PHP. Here, we are going to discuss how to set up Apache and PHP on Ubuntu.

Installation Prerequisites

To complete the installation successfully, you need to install Ubuntu 20.04 server first. For this, the account should have required permission and “sudo-“ enabled with a basic firewall. You can easily install the operating system with the required permissions to complete the installation of Apache.

Apache Installation

Apache web server is the most popular and used web server. Several web hosts are using the server to host multiple sites. The popularity of this server is due to the reason as it can host multiple sites and maintain an active community of users. This is one of the servers that is being used for the last many years and is a default choice for host service providers.

Step 1: APT Upgrade

To install Apache using the package manager of Ubuntu you can use “apt.” Following commands are used by the “sudo” package users:

```
$sudo apt update
```

```
root@ubuntu:~# sudo apt update
[sudo] password for younis:
Hit:1 http://archive.ubuntu.com/ubuntu focal InRelease
Get:2 http://archive.ubuntu.com/ubuntu focal-updates InRelease [107 kB]
Hit:3 http://archive.canonical.com/ubuntu focal InRelease
Hit:4 https://dl.winehq.org/wine-builds/ubuntu focal InRelease
Get:5 http://archive.ubuntu.com/ubuntu focal-backports InRelease [98.2 kB]
Get:6 http://archive.ubuntu.com/ubuntu focal-security InRelease [107 kB]
Fetched 212 kB in 2s (106 kB/s)
