

- **24 FPS**

This is the standard rate determined to be the minimum speed needed to capture videos while still maintaining realistic motion. Generally, this speed is used to shoot movies, TV shows, feature films, and web series.

- **30 FPS**

For years, this has been a common choice for television and is still widely used even when some producers have moved to 24 fps.

- **60+ FPS**

Anything that is higher than 30 fps is generally used to record slow-motion videos or game footage. As the technology evolves, smartphones and tablets are now able to record at 60 fps.

Motion

Another essential factor to consider while choosing the frame rate is the amount of motion in your video. If you've got a considerable amount of motion, then you probably have to capture the video at a higher frame rate to maintain the video quality.

To help you figure out which frame will best suit your needs, we have curated a list of standard options and how they're used.

- **24 FPS**

If you capture a high motion or busy scene at 24 fps, then the chances of capturing the video while maintaining realistic motion is minimised.
