

- **30 FPS**

Scenes with high motion can be recorded with 30 fps. However, the motion will start to look unnatural and will suffer from the “soap opera effect.”

- **60+ FPS**

Any busy scene with a lot of motion, such as video games, or live sports, is preferably recorded at 60+ fps for a realistic experience.

Video delivery

The way the video is delivered and the device the viewer uses to view a video greatly impacts the option of frame rates. Note that not all devices support all frame rates, so it's advisable to tackle this issue before filming.

Let's have a look at some of the familiar places your video may stream:

- On the internet
- Short video apps
- Television
- Film projectors

How to change the video resolution on Android?

This is how you set the resolution on Android devices-

- Display the camera app's shooting modes
- Click on the setting icon
- Select the resolution and quality
- Select a mode and a camera
- Choose the appropriate resolution or video quality setting from the list.

How to change the video resolution on iOS?

This is how to set the resolution on iOS:

- Open the camera app on your iOS smartphone
- Swipe below the viewfinder to select video or slo-mo.
- Video resolution and frame rate labels will appear in the top right corner
- Tap either label to change your image quality settings.

Final thoughts

Choosing the right frame rate and video resolution requires some thought to achieve the expected results. Recording and editing are two strong pillars of producing a good video; hence it's essential to set the right frame rate, coupled with the ideal resolution compatible with most devices.
