

- There will be two taps on both sides of the videos.
- To start the editing process, edit the start point and the endpoint of the video.
- Press and hold on to the start point tab and scroll it to the right.
- Once you've deleted the unwanted part of the video, it will no longer appear in the original video.

Method 2- Splitting videos

- In case you don't want the middle portion of the video, you can create a split.
- Click on the top icons and choose the right option to trim your video.
- Click on the pre-cut option, and then split.
- If you want to trim the video in between, press on pre-cut, where you can trim, cut, and split the video.
- Press on undo to reverse the edit.

Trim, Cut, Split!

These are the two methods of video trimming; choose the method which is more convenient to you and suits your needs. Remember to choose wisely and keep the UNDO button handy.

The split clips can also be rearranged by pressing and holding as we did earlier. This allows you to make endless edits as per your liking.

Final thoughts

InShot is an excellent video editing app, especially for marketers and editors who like exciting features. If you want to apply filters, add effects, make edits, trim, split, or cut your videos, InShot lets you do all that with ease!

The InShot app interface is minimal and realistic, which makes it easy for beginners. However, it is packed with exciting features that aren't available in any other video editing app at this price.

In the next chapter, we discuss video transitions in detail, so stay tuned!
