

- **Slice**

This transition is becoming more and more popular. As the name suggests, the slice transition quickly joins the half-altered video into two parts within a fraction of seconds, so it resembles as natural as possible. This really cool effect is often used in wedding videos.

- **Light**

This is another popular transition effect. It is basically when light travels in a drop or square-like form to show the transition between videos or images. The effect is a little more of a novelty than the fades and dissolve, but can be used creatively.

Apart from the primary transition effects, all the other transitional effects are available in the paid version and can be used only by InShot Pro users. You can choose the trial version if you want to unlock the paid transition effects.
