

Keyframes

Keyframing is a fundamental element of video creation, animation, motion graphics, and effects. Earlier, the process of keyframing took up hours and sometimes even weeks as each frame of production had to be drawn by hand. To speed up this process, where the elements can move just by defining the start and the endpoint of the action, is keyframing.

In simple words, “keyframe is basically the instruction set for stickers or text to move without any command”.

How to use keyframes with text and stickers?

Another exciting feature with text and stickers is the ability to set keyframes. The keyframe denotes how the frame can independently change the parameter values in a video clip in a hassle-free manner. Follow these steps-

- Open the InShot app on your Android or iOS device.
- Import your video in the InShot app by clicking on the video option.
- Once you’ve added the text or stickers in the chosen video, you are ready to add keyframes.
- Scroll right from where the sticker starts and press it.
- Click on the keyframe option to start the keyframe animation.
- The animation will form in the direction you move the text or the sticker.
- You can increase or decrease the size of the text.

Now that you’ve got the right information about keyframes and how to apply keyframes with text and stickers, it’s your turn to experiment and showcase your creative side to the world.

Final thoughts

It’s undeniable that learning video editing is a complex task that requires utmost patience and determination. But InShot makes it easy and is a perfect video editing app consisting of the goodness of filters and the power of keyframes.

We hope this InShot guide was helpful and has solved most of your queries before you kickstart an exciting ride in the editing world! All the best!
