

Introduction

With more demand for services in the field of filming, more and more people are inclined to learn the art of video editing. Although it is a complete package where a lot of steps have to be taken, one of the most important things to learn in video editing is how to import and sort videos on the timeline.

If you have taken a few classes or learned a little bit about video editing applications, you must know that the workspace where the entire editing is done is called the timeline. This is the place where you keep adding raw videos and images that you have to use in your edited video. Now, importing and sorting your files (videos) is an essential part of video editing. But, it isn't that difficult. This article will help you understand the process.

How to import videos on the timeline and make quick cuts

So, let's break this into two parts. First, we will learn how to import the videos from your desktop or any other location to the timeline. After that, we will look at sorting them, which comparatively is easier. To organise your timeline, you will have to import your videos. Firstly you need to locate all the raw videos and bring them to one place.

Some applications can give you easy access to setting the frame, duration, and transition.
