Transitions

Crossfade and cross-dissolve are common editing techniques that help to connect shots and add refinement to an edit. To give your piece a suitable start and finish, it's always a good idea to start a video on a fade-in and conclude it on a fade-out.

Dissolves have a more relaxed feel than cuts and may be used to create a meandering tempo, meditative atmosphere, and so on. Dissolves work nicely with scenery sequences and picture montages. Dissolves may also indicate the passage of time or a change in place.

Glitch

The “Glitch” effect has rapidly become one of the most popular visual effects, and it works particularly well for transitioning between two views. Glitchy tech used to be nothing more than pain and a sign that something wasn't functioning properly, but today the glitch changes completely when utilized with meaning and purpose. Glitch effects, made popular by science fiction and future films and television, combine beauty with the disorder, particularly when used as a transition.

While there are numerous settings available, there are countless ways to create your own perfect “glitch,” which is where the fun lies. The options are limitless, from separating RGB layers to offsetting layers, playing with noise levels, and warping the picture.

You must first install the Anaglyph Slide effect from the app's Asset Store before you can begin producing a glitch movie with KineMaster. After installing the effect, you can import the file you want to modify and continue to create cuts, apply transitions, or add a voiceover. After you've finished all of your
