

The main editing page

You may modify media once it's been imported into the project. For example, when you select the imported photo or one of the videos, a yellow frame appears. Accessible editing tools, such as the scissors symbol, suggesting a trimming tool, are located on the right hand. You may also trim, speed up, rotate or crop the video.

Adding any transition to your projects is straightforward. Again, select a video, and choose more options this time. Among each video, you'll notice a grey square-shaped icon with a thin line in the middle section. To insert a transition in your project, tap on the square icon.

You may change transition effects and other choices by tapping on them. There are options for 3D transitions, conventional, amusing, dramatic, presentation, picture-in-picture, text. After you've completed inserting a transition, tick the box at the top. Next, scroll to the beginning of the video and hit the play button to preview the transitions.

Managing the speed of the video
