

How to speed up or slow down a frame

In KineMaster, you can quickly speed up or reverse a frame. This is beneficial when you need to minimise the size or runtime of your movie. You may even reverse the frame or the entire video to play it backward.

1. After you've added your media, choose a video.
2. Select the factor you wish to slow down in the video from the right taskbar's speed menu.
3. You may manually slow down a video segment by cutting it to the correct length and then slowing it down.

To reverse the video:

1. Add your images and videos.
2. From the right-hand taskbar, select reverse.
3. It will rewind the video to the point where you chose it.
4. You may clip the movie and only reverse a certain section, or you can even reverse a frame by trimming the frame.

How to flip, duplicate, or freeze a frame

Flipping or freezing a frame is a breeze using KineMaster. You might want to freeze a frame to highlight a certain scene. A frame can also be flipped to correct its alignment or make it look mirrored.

1. Add your images and videos.
2. In the right-hand toolbar, go to the trim section.
3. Insert a freeze frame using the fourth option, split.
4. The frame from the same part can also be duplicated.
