

The color filter in KineMaster App

1. **Basic** - This is the first option that the editor can use to change the look of the video or picture. The basic filters can apply sepia tones, offer colour isolation, hue adjustments, isolations and channel shifts to your videos to give it an amazing contrast.
2. **Cold** - The cold feature has colour options that reduce the temperature of the picture or video. It is generally used to make the media brighter.
3. **Warm** - The warm filter increases the colour temperature of the picture.
4. **Vivid** - Vivid filters help increase the saturation of the pictures. The colour saturation is the purity and intensity of the colour displayed.
5. **Monochrome** - This filter shifts the saturation of the media to sepia tone. The monochrome filter also eliminates the colour saturation from the selected media.
6. **Low saturation** - As the name suggests, this filter reduces the colour intensity and saturation of the selected media. The less colour saturation of the image pushes it closer to the grey scale.

RGB curve

An RGB curve is like a colour correction tool. An RGB curve tool gives the editor four curve option tools, including the luma curve. With the use of a shaping curve, the editor can change the look of the video. Using this filter, the editor can transform the entire look of his project.

Tint filter

This filter helps in setting the tint of the entire clip. It is a simple tool, but its simplicity cannot detract from its flexibility. This filter allows the video editor to tint their video in one particular colour. In KineMaster, the editor can select
