Glitch filter

The Glitch filter is one of the oldest transition filters used in videos to add a unique touch. It is a form that shows some flaws in the original image. The lines get blurred out. You can use this filter while creating a transition in your video.

Style name filter

This filter helps in adding new animations to the text in the video. To add the style name filter first, you will have to add text to your video content. Then select a suitable font for it. Once this is done, you will have to add the selected effect you wish to represent your text.

Adjustment filters

Adjustment filters help in toning the look of the media without changing the pixels. The adjustment filters define the brightness, contrast and saturation. Thus, it makes the media look more enhanced and sharp. Let's look at these filters individually to understand them better.
