

1. **Brightness** - This filter helps in adjusting the brightness of the media according to the editor's requirements. For example, if the image is too bright, he can reduce the brightness naturally by scaling down the number.
2. **Contrast** - The contrast filter is used to set the object's appearance by softening the highlighted parts. It gives a very natural effect to the media.
3. **Saturation** - Saturation in the adjustment filter helps in reducing or enhancing the colour intensity of the media. These filters add a new edge to your project and make it stand out.

On beat feature in KineMaster app

Audio filters

If the editor wishes to add audio in his media while editing the video, KineMaster lets them do so. Yes, audio can be recorded and added over the media file to make it appealing. The audio filter in the KineMaster app helps edit the existing audio file to set it over the media. In the audio filter, the editor has an option to change the voice into different characters. For example, the audio applied to the media can be adapted to a chipmunk, alien, etc.

Get new project

Get new project is a recent filter that has been added to the KineMaster app. Instagram reels and TikTok videos have become very popular in recent times. Because of this, many people have started creating short videos. This new filter, 'get projects', has a list of short videos that the editor can download and use. The videos here are categorised into various categories for easy usage. Some of the sections are:

1. **Retro** - The videos present here represent the 70's era. The colour, feel, and music included in these videos are vintage and reminiscent of a bygone era.
