

Keyframes are points along a route that an object travels for those unfamiliar with keyframe animation. A basic keyframe animation may include two keyframes: a start and an endpoint. Hundreds of keyframes are there in more advanced animations. The number of keyframes that a layer can have is unrestricted in KineMaster.

You can animate your words, cliparts, chroma key, and pretty much any other layer you make. Basic animations such as: in animations, out animations, overall animations, and so on can be entered. KineMaster's Animation Tool lets you add/generate short animations to/in your video. You can pick from the settings that are currently available. If you're working on a layer, you may also create your animations by defining the route of the animation using "dots" or "navigation pathways."

KineMaster also lets you use the chroma key, which is a fantastic tool to have. You may use any color as a mask, and you can subsequently modify the motions on your chroma key layer. You don't need to subscribe or upgrade to the premium version to use the chroma key feature. The chroma key option appears when you import an image or video with a green backdrop (usually).

Types of animation

KineMaster Pro Video Editor comes with a large variety of pre-installed animations that you can use to add to your movies, messages, and photos. The animations available in KineMaster Pro Video Editor are listed below. These will help you take a closer look at KineMaster's Animations.
