

In Animation: When a particular character (layer) enters the video clip, the “In Animation” section contains animations. Take, for instance, the title of your video. You certainly want it to appear in your video, but in a stylish manner. A compilation of all the animations under the “In Animation” category are Fade, Pop, Spin CW, CCW, Drop, Letter by Letter, Wipe Left, Right, Up or Down, Pop Outward, Down, Up Slide Right, Left, Up or Down and Open, Rubber Stamp, Enter Slide Up, Down, and Left or Right.

Overall Animations: The “Overall Animations” function is similar to the “In Animation” function for different periods. Both “In” and “Out” Animations only function once. You can see this animation in effect when a text arrives or departs. The Overall Animations, on the other hand, remain until the text or the clip stops. These are Blink Slow, Flicker, Jitter, Fountain, Floating, Drifting, Ring, Pulse, SpinCW, and CCW.

Out Animations: When a specific character or clip closes or departs the video, “Out Animations” occurs. Animations comparable to those found in “In Animations” are found in “Out Animations.” But, there are a few more additional animations in this section. Some of them are Diverge, Snap, Closed, Inward, Up and Down, Exit Slide Up, Down, and Left or Right.

Process of adding animation in KineMaster

Step 1: Launch KineMaster and import your clips

You are free to use any clips you like. A clip is essentially a little video.

Step 2: Go to Layer > Text and type something

Now, just for the sake of demonstration, add some text. You may type whatever you wish. All we have to do now is master the fundamentals of animation. You can also use a layer to add another image. It'll function perfectly well.

Step 3: Choose the animation you want

After you've finished with the layers, you may go on to the next step. Select the desired animation from the listed animation categories by tapping on the top layer.

After you've decided on an animation, slide the time bar (0.5, 1.0, 1.5, 2.0, etc.) and select a value that corresponds to your clips. Those numbers control the speed of animation. They are in charge of determining how long your animations will last. If it's 0.5 or below 1.0, your animation will have a quick start and finish. The animations will stay longer if you increase the length of the animation.
