

Creative Cloud package and this comparison will help you make better choices. The main focal point which will help you pick just one among the two is determining your primary use case and making peace with what capabilities you are ready to compromise on.

We've taken some of the fundamentals defining elements of the software and pitted them against each other here:

1) Ease of Use

The most important detail for beginners, Premiere Pro is easily one-up on After Effects here as it's much less complicated and users can get to work right off the bat.

2) User Interface (UI)

After Effects has a very overwhelming interface for the beginners and it can take a few tutorial hours to just understand the basics of this software. Premiere Pro on the other hand is a lot more intuitive and functional.

3) Animation

Simple text and motion graphics can be done on both but After Effects has way more features and functionality with the same. When it comes to Character Animation though, only After Effects is capable of making a Mickey or a Mini.

4) Visual Effects

Both are capable (almost) when it comes to the most fundamental visual effects but that's only with regard to function, when it comes to quality After Effects is better. But for the average user, there won't be a need to use AE in the first place.

5) Advanced Visual Effects

This is entering exclusive After Effects territory. Rotoscoping, Keylighting and 3D motion graphics, you name it, it's all AE.

6) Workflow

Premiere Pro trumps AE because it holds all the cards, with all the edits and cuts being stored here. With Dynamic linking, the end game is always Premiere Pro. The changes are stored here, thus making AE just a processing unit.
